S4-1613	Datasheet of S4-1613 standalone GPS module	1.4

## 1 Introduction

LOCOSYS S4-1613 GPS module features high sensitivity, low power and ultra small form factor. This GPS module is powered by SiRF Star IV, it can provide you with superior sensitivity and performance even in urban canyon and dense foliage environment. Optional Built-in EEPROM realizes SiRF CGEE (Client Generated Extended Ephemeris) function that predicts satellite positions for up to 3 days and delivers CGEE-start time of less than 15 seconds under most conditions, without any network assistance. Besides, MicroPowerMode allows GPS module to stay in a hot-start condition nearly continuously while consuming very little power.

## 2 Features

- SiRF Star IV high sensitivity solution
- Support 48-channel GPS
- Fast TTFF at low signal level
- Built-in active jammer remover to track up to 8 CW jammers
- Support Trickle Power Mode, Push To Fix Mode and Micro Power Mode
- Capable of SBAS (WAAS, EGNOS, MSAS)
- Support Japan QZSS
- Free CGEE technology to get faster location fix (optional)
- Built-in LNA (on chip) and SAW filter
- Small form factor 15.9 x 13.1 x 2.2 mm
- SMD type with stamp hole; RoHS compliant

## 3 Application

- Personal positioning and navigation
- Automotive navigation
- Marine navigation

## 4 GPS receiver

Chip	SiRF Star IV, GSD4e ROM	
Frequency	L1 1575.42MHz, C/A code	
Channels	48	
Update rate	1Hz	
Sensitivity	Tracking	Up to -163dBm (with external LNA)
	Navigation	Up to -160dBm (with external LNA)
	Cold start	Up to -148dBm (with external LNA)
Acquisition Time	Hot start (Open Sky)	< 1s (typical)
	Hot start (Indoor)	< 15s
	Cold Start (Open Sky)	32s (typical)
		< 15s (typical), CGEE-start
Position Accuracy	Autonomous	< 2.5m CEP
	SBAS	2.5m (depends on accuracy of correction data)
Max. Altitude	< 18,000 m	
Max. Velocity	< 515 m/s	
Protocol Support	NMEA 0183 ver 3.0	4800/9600 bps <sup>(1)</sup> , 8 data bits, no parity, 1 stop bits (default) 1Hz: GGA, GSA, RMC 0.2Hz: GSV
	OSP Binary	115200 bps, 8 data bits, no parity, 1 stop bits

Note 1: Both baud rate and output message rate are configurable.

## 5.2 Proprietary NMEA input message

Table 5.2-1 Message Parameters

Start Sequence	Payload	Checksum	End Sequence
\$PSRF<MID> <sup>1</sup>	Data <sup>2</sup>	*CKSUM <sup>3</sup>	<CR><LF> <sup>4</sup>

1. Message Identifier consisting of three numeric characters. Input messages begin at MID 100.
2. Message specific data. Refer to a specific message section for <data>...<data> definition.

- CKSUM is a two-hex character checksum as defined in the NMEA specification, *NMEA-0183Standard For Interfacing Marine Electronic Devices*. Use of checksums is required on all input messages.
- Each message is terminated using Carriage Return (CR) Line Feed (LF) which is \r\n which is hex 0D0A. Because \r\n are not printable ASCII characters, they are omitted from the example strings, but must be sent to terminate the message and cause the receiver to process that input message.

Note: All fields in all proprietary NMEA messages are required, none are optional. All NMEA messages are comma delimited.

Table 5.2-2 Proprietary NMEA input messages

Message	MID <sup>1</sup>	Description
SetSerialPort	100	Set PORT A parameters and protocol
NavigationInitialization	101	Parameters required for start using X/Y/Z <sup>2</sup>
SetDGPSPort	102	Set PORT B parameters for DGPS input
Query/Rate Control	103	Query standard NMEA message and/or set output rate
LLANavigationInitialization	104	Parameters required for start using Lat/Lon/Alt <sup>3</sup>
Development Data On/Off	105	Development Data messages On/Off
Select Datum	106	Selection of datum to be used for coordinate transformations

- Message Identification (MID).
- Input coordinates must be WGS84.
- Input coordinates must be WGS84

### ● 100---SetSerialPort

This command message is used to set the protocol (SiRF binary or NMEA) and/or the communication parameters (Baud, data bits, stop bits, and parity). Generally, this command is used to switch the module back to SiRF binary protocol mode where a more extensive command message set is available. When a valid message is received, the parameters are stored in battery-backed SRAM and the Evaluation Receiver restarts using the saved parameters.

Table 5.2-3 contains the input values for the following example:

Switch to SiRF binary protocol at 9600,8,N,1

\$PSRF100,0,9600,8,1,0\*0C

Table 5.2-3 Set Serial Port Data Format

Name	Example	Units	Description
Message ID	\$PSRF100		PSRF100 protocol header
Protocol	0		0=SiRF binary, 1=NMEA
Baud	9600		4800,9600,19200,38400,57600,115200
DataBits	8		8,7 <sup>1</sup>
StopBits	1		0,1
Parity	0		0=None, 1=Odd, 2=Even

Checksum	*0C		
<CR><LF>			End of message termination

1. SiRF protocol is only valid for 8 data bits, 1 stop bit, and no parity.

## ● 101---NavigationInitialization

This command is used to initialize the Evaluation Receiver by providing current position (in X, Y, Z coordinates), clock offset, and time. This enables the Evaluation Receiver to search for the correct satellite signals at the correct signal parameters. Correct initialization parameters enable the Evaluation Receiver to acquire signals quickly.

Table 5.2-4 contains the input values for the following example:

Start using known position and time

Checksum	*1C		
<CR><LF>			End of message termination

1. Use 0 for last saved value if available. If this is unavailable, a default value of 96000 is used.

Table 5.2-5 Reset Configuration

Hex	Description
0x01	Hot Start – All data valid
0x02	Warm Start – Ephemeris cleared
0x03	Warm Start (with Init) – Ephemeris cleared, initialization data loaded
0x04	Cold Start – Clears all data in memory
0x08	Clear Memory – Clears all data in memory and resets the receiver back to factory defaults

## ● 102---SetDGPSPort

This command is used to control the serial port used to receive RTCM differential corrections. Differential receivers may output corrections using different communication parameters. If a DGPS receiver is used that has different

communication parameters, use this command to allow the receiver to correctly decode the data. When a valid message is received, the parameters are stored in battery-backed SRAM and the receiver restarts using the saved parameters.

Table 5.2-6 contains the input values for the following example:

Set DGPS Port to be 9600,8,N,1.

\$PSRF102,9600,8,1,0\*12

Table 5.2-6 Set GPS Port Data Format

Checksum	*12		
<CR><LF>			End of message termination

Note: RTCM is not supported.

### ● 103---Query/Rate Control

This command is used to control the output of standard NMEA messages GGA, GLL, GSA, GSV, RMC, and VTG.

Using this command message, standard NMEA messages may be polled once, or setup for periodic output. Checksums may also be enabled or disabled depending on the needs of the receiving program. NMEA message settings are saved in battery-backed memory for each entry when the message is accepted.

Table 5.2-7 contains the input values for the following example:

1. Query the GGA message with checksum enabled

\$PSRF103,00,01,00,01\*25

2. Enable VTG message for a 1 Hz constant output with checksum enabled

\$PSRF103,05,00,01,01\*20

3. Disable VTG message

### ● 104---LLANavigationInitialization

This command is used to initialize the Evaluation Receiver by providing current position (in latitude, longitude, and altitude coordinates), clock offset, and time. This enables the receiver to search for the correct satellite signals at the correct signal parameters. Correct initialization parameters enable the receiver to acquire signals quickly.

Table 5.2-9 contains the input values for the following example:

Start using known position and time.

0x08	Clear Memory – Clears all data in memory and resets receiver back to factory defaults

## ● 105---Development Data On/Off

Use this command to enable development data information if you are having trouble getting commands accepted. Invalid commands generate debug information that enables you to determine the source of the command rejection. Common reasons for input command rejection are invalid checksum or parameter out of specified range.

Table 5.2-11 contains the input values for the following example:

### 1. Debug On

\$PSRF105,1\*3E

### 2. Debug Off

\$PSRF105,0\*3F

## ● 106---Select Datum

\$PSGPS receivers perform initial position and velocity calculations using an earth-centered earth-fixed (ECEF) coordinate system. Results may be converted to an earth model (geoid) defined by the selected datum. The default datum is WGS 84 (World Geodetic System 1984) which provides a worldwide common grid system that may be translated into local coordinate systems or map datums. (Local map datums are a best fit to the local shape of the earth and not valid worldwide.)

Table 5.2-12 contains the input values for the following example:

Datum select TOKYO\_MEAN

### ● 117---System Turn Off

This message requests that the GPS receiver perform an orderly shutdown and switch to hibernate mode.

35	NC		Not connected	
36	GND	P	Ground	

### <Note>

1. In order to get the advantage of CGEE, this pin must be always powered during the period of effective ephemeris prediction.
2. Input voltage is 3.6V tolerant.
3. Input pulse to switch the module between different power modes.
  - ON\_OFF pulse requires a rising edge and high level that persists for three cycles of the RTC clock in order to be detected. Resetting the ON\_OFF detector requires that ON\_OFF goes to logic low for at least three cycles of the RTC clock.
  - If the module is in hibernate state, an ON\_OFF high will move it to full-power mode.

- If the module is in MicroPower mode, an ON\_OFF pulse will move it to full-power mode.
- If the module is in AdvancedPower mode, an ON\_OFF pulse will initiate one AdvancedPower cycle.
- If the module is in TricklePower mode, an ON\_OFF pulse will initiate one TricklePower cycle.
- If the module is in Push-To-Fix mode, an ON\_OFF pulse will initiate one Push-To-Fix cycle.
- If the module is already in full-power mode, an ON\_OFF pulse will initiate orderly shutdown.

A0	13.50 ±0.1
B0	16.40 ±0.1
D0	∅1.5
E1	1.75 ±0.1
K0	2.70 ±0.1
P0	4.0 ±0.1
P1	24.00 ±0.1
P2	2.0 ±0.10
T	0.3 ±0.10
W	24.0 ±0.30

1. 10 sprocket hole pitch cumulative tolerance  $\pm 0.2$
2. Camber not to exceed 1mm in 100mm
3. A0 and B0 measured on a plane 0.3mm above the bottom of the pocket
4. K0 measured from a plane on the inside bottom of the pocket to the top surface of the carrier .
5. pocket position relative to sprocket hole measured as true position of pocket, not pocket hole.
6. Component load per 13" reel: 1000 pcs
7. Packing length per 22" reel: 75 M

## Document change list

### Revision 1.0

- First release on Jan. 17, 2012.

### Revision 1.1 (February 6, 2012)

- Changed autonomous position accuracy from 3m 2DRMS to < 2.5m CEP in the section 4.
- Changed typical Backup Battery Current from 34uA to 640uA in the section 8.2.
- Removed Note 3 in the section 8.2.

### Revision 1.2 (August 3, 2012)

- Upgraded GPS chip to 9333.
- Changed the acquisition current from 54mA to 56mA in the section 8.2
- Changed the tracking current from 36mA to 33mA in the section 8.2
- Changed the hibernate current from 170uA to 430uA in the section 8.2
- Changed the backup current from 640uA to 660uA in the section 8.2
- Changed the maximum backup current from 730uA to 830uA in the section 8.2

### Revision 1.3 (August 20, 2012)

- Added support EGNOS on page 1
- Added support Japan QZSS on page 1

### Revision 1.4 (June 24, 2013)

- Changed tolerance from  $15.9 \pm 0.15$  to  $15.9 \pm 0.2$  on page 18
